Student Name:	Lily Delle D. Paciente
Group:	MiniOS Omega
Assigned Role:	Leader

What did I contribute to the project?

I collected all the requirements that needed to be submitted on GitHub and Canvas. I coordinated the group so that there will be an equal distribution of the work among all group members. I reviewed the MiniOS code. I created the screenshots and screen recordings of MiniOS. I provided the voice-over for the MiniOS demonstration in the video demo.

What features did I personally develop?

As the leader, my responsibility involves the coordination of the project, review of the code, and creation of the documentation rather than developing one single module. I reviewed the MiniOS' core features (command line interface, file management, process simulation, memory simulation, user login, system information, and error handling) in order to ensure their correctness and integration with one another. I also handled the screenshots and some video demonstration voice over.

What problems did I encounter?

- Checking that everyone's code worked together when it was combined into one program.
- Running MiniOS correctly in Windows CMD and recording a clean demo with no errors on screen.
- Collecting and organizing all the requirements for two platforms (GitHub and Canvas) before the deadline.

How did I solve those problems?

- I checked each member's code and tested the whole program, then asked members to fix any errors I found.
- I ran the program several times before recording, so the final screen recording showed every feature working.
- I made a checklist of the GitHub and Canvas requirements and tracked it until everything was submitted.

What did I learn from this project?
I learned that leading a team means communicating clearly, following up on each member's progress, and making sure everyone's work fits together into one working product. I also learned how an operating system's main parts work (processes, memory, files, and user access) by simulating them in Python, and why testing and error handling matter before a demo. I also got practice with GitHub for team submissions and with presenting a project through a recorded demo.

Evidence of my contribution:

- Screenshots of MiniOS running in Windows CMD
- Screen recordings of the MiniOS demonstration
- The video demo with my voice-over
- The GitHub repository (commits, README, and submitted files)
- The Canvas submission
