Student Name:	Zeddrick Whitfield
Group:	MiniOS Omege
Assigned Role:	CLI (Command Line Interface) Developer

What did I contribute to the project?
I built the Shell (CLI) for our Mini OS. This is the main interface the user sees to type commands and interact with the system.

What features did I personally develop?

- Command Prompt: The visual interface where the user types.
- Command Processing: The logic that reads what the user typed and executes the right function.
- help command: Displays a list of available commands.
- clear command: Clears the screen.
- exit command: Safely shuts down the shell.

What problems did I encounter?
Handling typing errors (typos) and unknown commands. If a user typed a command that didn't exist, or typed a command in all capital letters instead of lowercase, the system would crash or get stuck in a loop.

How did I solve those problems?
I added a basic input checker. I converted all user input to lowercase before processing it so capitalization didn't matter. I also added an else statement so thasst if the system didn't recognize a command, it would just print "Unknown command" and show the prompt again instead of crashing.

What did I learn from this project?
I learned how to take raw text from a user, break it apart (parsing), and use if/else logic to connect the user's input to the actual code functions.

Evidence of my contribution:

- The shell source code I wrote, including the command prompt, the command processing logic, and the help, clear, and exit commands, which can be found in the project's GitHub repository.
- The video demo of MiniOS, which shows the shell being used to run commands.
